Description

Aah68997 Human cer Aav56769 Human Fac Aad30987 Schizosac

New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.

Claim 1; SEQ ID NO 14603; 71pp + Sequence Listing; English.

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR)

```
This invention relates to a novel method (CE-SELEX, Capillary Electrophoresis-Systematic Evolution of Ligands by Exponential enrichment) of identifying nucleic acid Ligands of a target molecule from a candidate mixture comprised of single stranded nucleic acids each having a region of randomised sequence by contacting the mixture with the target molecule, where nucleic acids having affinity to the target molecule are partitioned from the mixture by capillary electrophoresis, amplifying increased affinity nucleic acids to yield a ligand-enriched mixture of nucleic acids. The invention may be useful for the production of compounds with an antiasthmatic, cerebroprotective, anti-HIV or
of the mRNA because they are often obtained from oligo-dT primed cDNA ibbraries. Such ESTs are not well suited for isolating CDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length CDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying nucleic acid ligand of target molecule from mixture comprising single stranded nucleic acids having region of randomized sequence by contacting mixture with target molecule, amplifying affinity

                                                                                                                                            research: Improved appeared are usered. In Gueraching unage, in vivo imaging and blosensors. The aptemers are also useful in quantitating targets apreases are used to develop high-present in complex matrices. The aptemers are used to develop high-sensitivity affinity probe capillary electrophoresis (APCE) assays, in ELISA type assays using enzyme-linked DNA aptemers. Thrombin aptemers may be developed for using fibre-optic microarray biosensors. Aptemers may histological markers to identify tumour microvessels. Aptemers may be developed for use in other aptemer-based assays, such as assays for analytes ranging from anthrax spores to cocaine. Aptemers having improved quality, improved binding efficiency and selectivity can be identified by the method of the invention. The present sequence is that of an aptemer DNA sequence which was identified using the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid for diagnosing and treating cervical cancer and for assessing and detecting compounds for treating the cancer.
virucide activity. The method is useful for identifying nucleic acid ligands of a target molecule from a candidate mixture comprised of single stranded nucleic acids each having a region of randomised sequence. Aptamers identified by the method are useful as a tool in analytical chemistry, useful in wide range of diagnostic assays and as direct benefits to many area of the research, including biomedical and health research. Improved aptamers are useful in developing diagnostic assays,

                                   cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition, to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be
                  invention relates to novel genes (AAH68727-AAH73383) associated with

plants and microalgae, ror providing transformed cells, and for providing a cell with an inserted polymucleotide sequence encoding one or more products of interest. The present sequence is a PCR primer used to inchinancharomyces nombe IPP isomerase encoding orf. This primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of specific genes of mevalonate and isoprenoid biosynthetic pathways, for providing a cell with herbicide or antibiotic resistance, and for providing transformed cells having increased isoprenoid production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to the use of specific genes of the mevalonate an isoprenoid biosynthetic pathways and inactive gene sites (pseudogene). Genes of the invention are used to enhance biosynthesis of isopentenyl diphosphate (IPP), dimethylallyl diphosphate (DMAPP) and isoprenoid pathway derived products in the plastids of transgenic plants and microalgae, for producing herbicide or antibiotic resistant transgenic plants and microalgae, for providing transformed cells with increased
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Schizosaccharomyces pombe IPP isomerase encoding orf sense PCR primer

AAV56751-V56775 are primers used in a method resulting in the production of novel human Factor X (F10) analoques. Such analoques have in the region of the natural F10a activation cleavage site, a modification that creates a processing site for a protease that does not naturally cleave F10 in this region. The proteins are used to generate, in vivo or in viro, F10a analogues that can be used to control bleeding and for treating defects of factors IX, VII or VIII, e.g.in haemophiliacs who acid can be used in gene therapy of the same conditions. The analogues have developed antibodies to factors VIII and/or IX. The encoding nucleic acid can be used in gene therapy of the same conditions. The analogues have high stability and can be activated without use of animal enzymes such as trypsin. Only activation is affected, their activity is the same as the natural factor. The analogues can be isolated as a pure singlecthain pro-protein (not usually possible because of rapid processing of the native precursor) and this converted to two-chain form by subsequent

The invention relates to the use of specific genes of the mevalonate and isoprenoid biosynthetic pathways and inactive gene sites (pseudogene). Genes of the invention are used to enhance biosynthesis of isopentenyl diphosphate (IPP), dimethylallyl diphosphate (DWAPP) and isoprenoid pathway derived products in the plastids of transgenic plants and microalgae, for producing herbicide or antibiotic resistant transgenic plants and microalgae, for providing transformed cells with increased isoprenoid production compared to non-transformed cells, and for providing a cell with an inserted polymucleotide sequence encoding one or more products of interest. The present sequence is an oligomorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of specific genes of mevalonate and isoprenoid biosynthetic pathways, for providing a cell with herbicide or antibiotic resistance, and for

The present invention relates to a purified and isolated non-naturally occurring DNA ligands to basic fibroblast growth factor (bFGF). The ligands are useful as part of gene therapy treatments and for diagnosing pathogenesis of vascular diseases including initiation and progression of atherosclerosis, acute coronary syndromes, vein graft disease and restanosis following coronary syndromes, the ligands have improved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           17 ACGAGCGGCUCUGGCCCCUUAAUUGUACUUCGGGCUCGUAUUGUCUCUCCUUUCGCCACC
                                                                                                                                                                                                                                                                                                                               Novel nucleic acid ligands to basic fibroblast growth factor that are useful as inhibitors of basic fibroblast growth factors and 2'-amino modified RNA ligands, exhibit increased in vivo stability.

Sense primer for PROEX-1-beta-synuclein delta 1 construction.

```
fibroblast growth factor (bEGF). These sequences were isolated using the primers and target regions given in AAQ98421-29 using systematic evolution of ligands by exponential enrichment (SELEX). DNA templates containing a region of 30 or 40 random nucleotides flanked by constant sequence regions, were synthesized. The constant regions were designed to be amplified by the primer. The primer 197.185 has 2 biotin phosphoramidites and two additional A residues covalently attached to its 5' terminus during synthesis. The random region was generated by utilising an equinolar mixture of the four nucleotides during oligonic encloses. Three pools of ssDNA were created that contain internal random regions. Each pool was incubated with bFGF at an excess of DNA to target. DNA bound to bFGF were selected by filtration. The selected single stranded DNA (sebNA) was then amplified by PCR. A significant improvement in affinity of DNA ligands was seen after 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identification of ligands to basic fibroblast growth factor and thrombin - which can be modified for increased in vivo stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            rounds of selection. Five distinct families of ssDNA were identified, based on regions of homology. Some sequences showed no obvious homology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sequences given in AAT00282-394 represent DNA ligands to basic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human NACP/alpha-synuclein, human beta-synuclein and its mutants, beta-synuclein delta 1 and 2 were produced using the PROEX-1 6xHis expression system. PROEX-1-beta-synuclein delta 1 was constructed by a two step PCR protocol. This sense primer, corresponding to amino acids 73-83 of alpha-synuclein and amino acids 73-79 of beta-synuclein, was used with antiense primer BSYNNOT (AAA09071) encoding amino acids 129-134 of beta-synuclein and Not1 site at its 5' end. The PCR product was combined to the product generated by primers AAA09068-69 by using BSYNNDE (AAA09068) and BSYNNOT. The invention concerns methods for screening treatments for,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               and treatment of, neurodegenerative disease. The methods comprise measuring aggregation of neurons of NACP/alpha-synuclein and stimulating expression of a non-amyloidogenic protein in order to reduce the level of aggregation. In the screening method, oxidative stress is stimulated in the neuronal cells by introduction of metal ions and hydrogen peroxide. The methods are useful for treating and screening treatments for neurodegenerative disease consisting of Alzheimer's disease, Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                         Screening treatments for neurodegenerative disease, such as Alzheimer's disease, comprises stimulating oxidative stress and measuring and aggregation of non-amyloid beta component /alpha-synuclein in neuronal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Rat spliced transcript detection oligonucleotide SEQ ID NO:3993.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to a system for profiling hematological cancer, comprises polynucleotide probes comprising a sequence corresponding to, comprises polynucleotide probes comprising a sequence corresponding to, compulementary to, an mRNA transcribed from candidate genes whose expression pattern is indicative of one or more feature of a hematological cancer chosen from lymphoma and leukemia. The hematological cancer chosen from lymphoma and leukemia. The hematological cancer is a lymphoma chosen from lymphoma, splenic marginal zone B-cell lymphoma, nodal marginal zone B-cell lymphoma, cell myeloma/plasmacytoma, FL, MCL, Burkitt's lymphoma, DLBCL, Hodgkin's lymphoma, lympholastic
Clymphoma, ALCL, cutaneous T-cell lymphoma, myeloma/plasmacytoma, respincemental T-cell lymphoma, intestinal T-cell
Clymphoma, and adult T-cell lymphoma), intestinal T-cell
Clymphoma, and adult T-cell lymphoma, intestinal T-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                   System for profiling hematological cancer, comprises probes complementary to mRNA transcribed from candidate genes whose expression pattern is indicative of a feature of the cancer e.g. MYH11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            a leukemia chosen from acute myelogenous leukemia, acute lymphocytic leukemia, chronic myelogenous leukemia, and chronic lymphocytic leukemia. The system is useful for the preparation of a nucleic acid array. The system enables accurate diagnosis and risk assessment of the hematological cancer. The present sequence represents a hematological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rat; antisense oligonucleotide; ss; antisense RNA production; oncogenes;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           messenger RNAs that populate a (sub-)transcriptome, where the (sub-
) transcriptome comprises messenger RNAs transcribed from multiple
transcription units that populate a genome. The library comprises several
oligonucleotides, each capable of hybridising selectively to a set of
messenger RNAs transcribed from a given transcription unit of the genome,
which encodes one or more messenger RNA splice variants. The
oligonucleotide libraries are useful for detecting mRNAs from a
biological sample, in expression profiling studies, in qualitatively or
can sample transcripts and splice variants of human or animal
transcriptomes. The libraries may also be used as specialised min
clibraries to detect transcripts of a sub-transcriptome under a particular
biological or pathological state, and so allowing the detection of tissue
and pathology-specific genes such as those genes only expressed in
specific tissue under a specific pathological condition; to detect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          developmental specific genes, and to defect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular disorder. ABN27233 to ABN59589 represent oligonucleotide sequences from rats, humans and mice, which are used in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of genome, useful for detecting tissue-, pathology-, and developmental-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes oligonucleotide libraries for detecting

The invention relates to a method of identifying an individual having altered risk of or susceptibility for developing acute myocardial infarction (AMI) which comprises providing blological sample of individual, collecting personal and clinical information, determining nucleotides present in polymorphic sites of single nucleotide or underday associated with AMI, and combining single SNP markers data with personal and clinical information. The method is useful for identifying an individual having an altered risk of or susceptibility for developing susceptibility or predisposition to AMI in an individual. The method is useful for identifying compounds useful in prevention or treatment of coronary heart disease (CHD) such as AMI. The method is useful for preventing or treating CHD such as AMI. The method is useful for diagnosing a human subject suffering from CHD such as AMI. The present suseful for diagnosing a subtype of AMI in an individual having AMI. The present sequence represents a human acute myocardial infarction (AMI) single not form part of the printed specification, but was obtained in the form the form part of the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying individual having altered risk of or susceptibility to develop acute myocardial infarction (AMI), comprises determining polymorphisms in AMI risk genes and combining polymorphisms data with personal and clinical information.
                                                                                                                                                                                                                                                                                                                                                                                             Salonen JT, Aalto J, Fuentes R, Kontkanen O, Pirskanen M;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          23.3%; Score 18.4; DB 15; Length 51; 41.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a standardising control for RNA samples to be tested on non-control gene sequences on nucleic acid arrays, comprising a pool of unique tagged synthetic antisense mRNA molecules of a known concentration, where any two sequences are unique if their sequences differ. The non-control gene sequences on the nucleic acid array comprise oncogenes, genes encoding tumour suppressors, cell cycle regulators, ion channel proteins, transport proteins, intracellular signal transduction modulator and effector factors, transcription factors, DNA-binding proteins, receptors or cell-cell communication proteins, stress response genes, apoptosis related genes, DNA synthesis/recombination/repair genes and DNA-binding proteins. The genes encoding receptors comprise receptors for growth factors, chemokines, interleukins, interferons, hormones, neurotransmitters, cell surface antigens or cell adhesion molecules. The genes encoding cell-cell communication proteins comprise growth factors, chemokines, interleukins, interferons or hormones. The genes encoding cell-cell communication proteins comprise growth factors, cytokines, chemokines, interleukins, interferons or hormones. The genes encoding cell-cell communication proteins comprise growth factors, cytokines, chemokines, interleukins, interferons or hormones. The sequences on nucleic acid arrays is useful for producing a population of distinct antisense RNA molecules from an initial population of distinct antisense RNA molecules from an initial population of machine the sequences of the second arrays is useful for producing an antisense oligonucleotide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                    New standardizing control for RNA samples to be tested on non-control gene sequences on nucleic acid arrays, useful for producing a population of distinct antisense RNA molecules from an initial population of

The present sequence is one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTS are derived from mRNAs with intect 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. S' ESTS are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                      New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                             Claim 1; SEQ ID NO 15806; 71pp + Sequence Listing; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This is the one of a pair of primers (see also AAX59389) used in the PCR amplification of a portion of the Saccharomyces cerevisiae genome incorporating the newly identified D9798.4 essential gene (see AAX59382). The primers hybridise to a portion of the 5' and 3' sequences flanking the D9798.4 open reading frame and include nucleotides that are homologous to the HIS3 selectable marker. The PCR product was used to construct a yeast strain in which the D9798.4 gene was deleted in order to confirm that this gene is essential for yeast survival. The D9798.4 gene is a homologue of the Aspergillus nidulans AN97 gene (see AAX59378). The genes and their encoded polypeptides can be used to identify homologous genes in other organisms and to identify novel antifungal or

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Section | Compared |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GENERAL INFORMATION:
APPLICANT: Dumas Milne Edwards, J.B.
APPLICANT: Duclert, A.
APPLICANT: Duclert, A.
APPLICANT: Giordano, J.Y.
TITLE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.
Patent No. 6783961
FILE REFERENCE: 59.052.REG
CURRENT APPLICATION NUMBER: US/09/513,999C
CURRENT FILING DATE: 2000-02-24
RIOR PELLING DATE: 1999-02-26
NUMBER OF SEQ ID NOS: 36681
                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                             79
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
